Tree Host

Minecraft server hosting, built from scratch

Investor one-pager
treehost.online · demo.treehost.online
October 2026

The Minecraft host that sells the same RAM for less — because its servers sleep.

Every competitor runs idle servers 24/7 and bills for the waste. Tree Host's servers hibernate when empty and start the instant a player joins — so the same machine sells far more server-slots. That is a structural cost advantage, not a discount: lower prices than Apex or Shockbyte with better margin per gigabyte. The product is built and working: try it at demo.treehost.online in under a minute.

Working product · **Payments live (Stripe)** · **Zero-dependency codebase** · **Built-in growth flywheel**

$5	~1 min	25	$2,000
entry price/month — Sapling 2GB (competitors: $7–10)	signup to playing — the simplest flow in the market	founding Lifetime spots at $199 — pre-sale now live	launch fund: first production server + 12 months runway

The model: sell sleeping capacity

PLAN	TREE HOST	TYPICAL HOST
2 GB	**$5.00**	$7.99–9.99
4 GB	**$9.00**	$14.99–19.99
8 GB	**$16.00**	$29.99–39.99
Lifetime	**$950 once**	rarely offered

Competitor prices from public plan pages, 2026. Tree Host's per-GB price is 35–60% lower while utilization stays high: a sleeping server holds a reservation but costs almost nothing to run, and the instant it wakes it earns. One 64 GB machine ≈ 60 Sapling-size servers ≈ **$300+/mo recurring** from ~$74/mo hardware.

The ask — $2,000 launch fund

Tree Host is pre-revenue by choice: the code is done, the hardware isn't rented yet. $2,000 turns the working product into a selling company.

$74/mo	~60	~$300+/mo
first production server (dedicated, 64 GB)	Sapling-size servers it can sell = capacity	recurring revenue at modest uptake

Milestone-based: fund the machine → first paying customer → fund scales with revenue. Founding Lifetime pre-sale ($199 × 25 = up to $4,975) covers the ask on its own.

The product moat

- **Crash doctor & lag doctor** — the server reads its own logs and explains failures in plain English with one-click fixes. Nobody else has this.
- **Zero-dependency platform** — the entire stack runs with no npm packages: fewer supply-chain risks, trivial to audit, cheap to run.
- **Built-in server list flywheel** — every customer server is listed publicly; players discover Tree Host from inside the game.
- **One-click everything** — Modrinth plugins/modpacks, proxy networks, Bedrock

Roadmap — next 12 months

1 · Launch
First production server live, first paying customers, founding pre-sale completes.

2 · Grow
Server templates, Discord-account linking, status page, second node when capacity demands it.

3 · Scale
Multi-node scheduling (already architected), more regions, community marketplace.

Why this team

crossplay, animated MOTDs, auto-backups. Setup friction is the #1 churn driver in this market.

Traction & proof

- Full platform shipped: accounts (Firebase), billing (Stripe), Docker-isolated servers, dashboard, staff console.
- Live funnel metrics: visitor → demo → signup → paid, counted server-side and visible to the team in real time.
- Community building in public: YouTube devlogs and an active Discord — the founding pre-sale is funded by the audience that watched it get built.
- Every claim on this page is verifiable in the public repo and on the live demo.

Builders who run servers themselves, shipping in public with a zero-dependency codebase that a small team can actually maintain. Small burn, working product, distribution through its own player-facing server list — the cheap kind of startup where the first $2,000 visibly changes the trajectory.
